

We turn **oil**
into a resource!

A YOUNG COMPANY WITH A LONG STORY !

Sapi Green Oil is an intercompany of the SAPI S.p.a. group, abbreviated as S.G.O. It is exclusively dedicated to the collecting and regeneration of used cooking oil for the production of biofuels.

SGO operates in the micro-collection sector at restaurants, hotels, canteens, and in the overall recovery of used cooking oil on the national territory (CER 200125), and proposes itself as a partner in the management of private and urban collection by actively collaborating with all types of used cooking oil producers, including municipalities and commons.

Sapi Green Oil, founded in 2019, is the largest national player in the collecting and regeneration of used cooking oil. We collect and regenerate a significant amount of used cooking oil every day. Thus recycling a waste into a raw material for the production of biodiesel.

SGO now has 5 regeneration plants, 11 collection plants, and other partnerships with companies all over the country.

In numbers

50000+
clients

Sapi Green Oil has around 50,000 clients within numerous restaurants and stores producing U.C.O. (Used Cooking Oil) throughout Italy.

Our impact

AND COMMITMENT TO THE PUBLIC

In response to the growing demand for a solution to the issue of used cooking oil leakage from home food preparation, Sapi Green Oil recently worked with municipalities and commons in the public collection of used cooking oil. Sapi Green Oil recycles more than 20,000 tons of used cooking oil each year.

A bit of history

form 1964

To date, the group has more than 20 production sites spread across the globe and can be considered one of the top five groups in the sector in terms of both annual turnover and the volume of residues processed annually.

SGO is born from Sapi S.p.A.

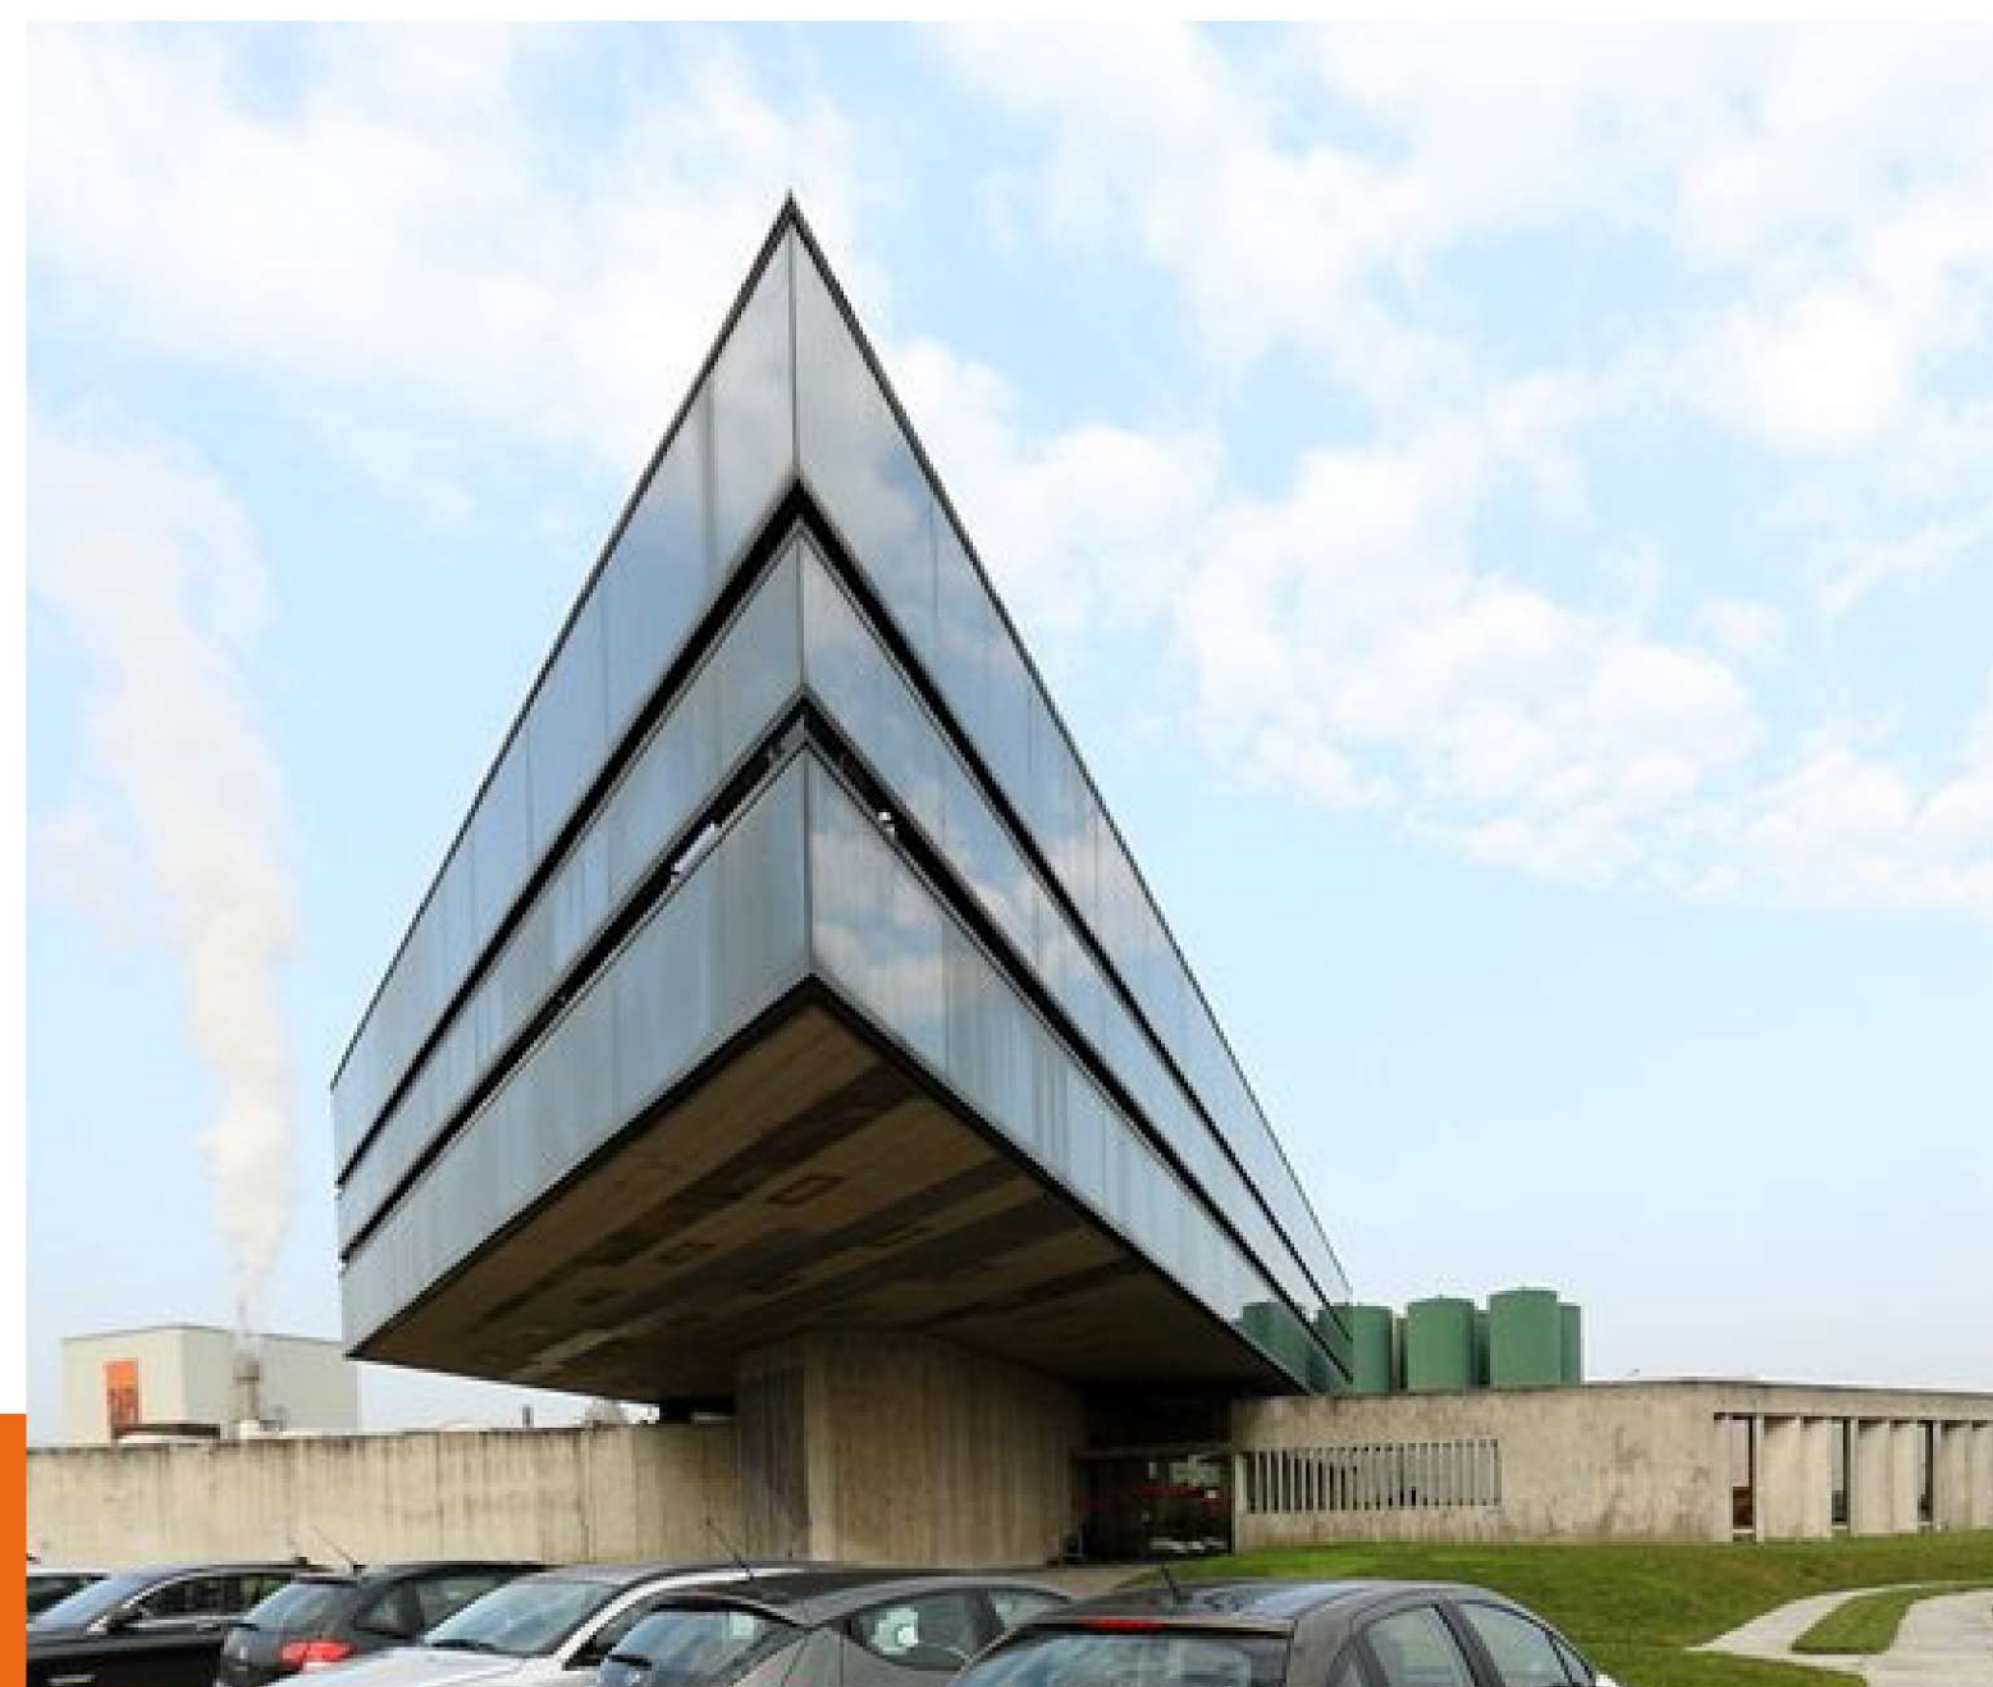

S.A.P.I.S.p.A. was founded as a slaughter industry byproducts processing company to produce processed animal proteins and fats for use in feed (livestock and pet food), industrial (oleochemical, fertilizers..) and energy (bioliquids and biofuels) markets.

Over the years, SAPI's investment in new production techniques and attention to quality control has allowed it to keep up with the times and increase its market share, thanks to the introduction of an innovative production system that guarantees the achievement and maintenance of high quality standards and health and hygiene safety over time. Sapi has established itself as a top company in both domestic and international markets throughout the years.

In recent years, a close attention has been turned to the so-called "eco-sustainable" renewable energy sources through the allocation of resources, both human and financial, in the research and development of new technologies that allow the use of animal fat and **used cooking oil** collected throughout the country in the production of energy and biofuels.

The Sapi spa group has opted to actively invest in the renewable sources collection industry in recent years.

SGO, an acronym for Sapi Green Oil, **was founded in 2019 as a company dedicated exclusively to the collection of used cooking oil CER 200125.**

*The past is a lesson
The future is our motivation*

WE COLLECT USED COOKING OIL

Who are our clients?

HORECA

These are our regular clients. With more than **10 years of experience** in the private catering sector with a VAT number, we serve a vast number of suppliers made up of **restaurants, hotels, canteens, camping, catering, etc.**

GDO

We collect from the **major national and international large-scale retail groups** and **provide** an effective tailor-made solution for large companies with several branches around **the country.**

CM

To **address the needs of municipalities**, we provide collecting solutions **on an urban scale**, both at CDRs/ecological islands and on the roadside. We plan city collections based on the territorial requirements of the individual municipalities.

Environmental dispersion

What is the problem?

According to a waste industry-specific analysis, a significant portion of **used cooking oil** produced by citizens is **mistakenly dumped into public drains** rather than being collected and sent to the proper authorized plants for regeneration, **causing significant harm to sewage networks and water purification facilities.**

The Solution

SGO has launched initiatives across the country to provide towns and municipalities with **specific containers** positioned in areas where residents' waste is collected.

A simple act to safeguard your local eco-system

A New Life

Regeneration

The product is typically added to the **biodiesel** production chain after the regeneration stage.

A **BIO** compound that may be added to diesel fuels **to reduce emissions of carbon monoxide, carbon dioxide, and fine dust is created during the transesterification process using ethanol.**

SGO is able to transform waste collected **into secondary raw material** through efficient regeneration plants, allocating the product to the sector of new generation fuels with a lower environmental impact, thus directly contributing **to respect for the environment and our planet.**
